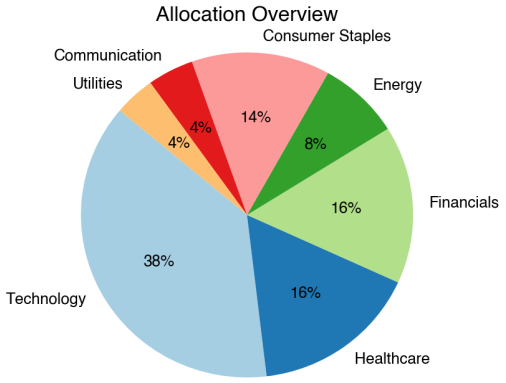
Portfolio Analysis Report

Quality Test Portfolio

Report Date: February 26, 2026

Value	Expected Return	Risk (Vol)	Sharpe Ratio
500,000 SEK	8.92%	18.45%	0.483



This report summarizes portfolio composition, Swedish tax impact, optimization results, and risk metrics. See following sections for methodology, detailed tables, and projections.

DISCLAIMER

This report is generated for informational and educational purposes only. It does not constitute financial advice, investment advice, tax advice, or any recommendation to buy or sell securities. Historical performance data presented herein is not indicative of future results. All projections and scenario analyses are based on assumptions that may not materialize.

The Swedish tax calculations reflect legislation as of the report date and are subject to change. Consult a qualified financial advisor and tax professional before making investment decisions. Portfolio Navigator Wizard and its affiliates assume no liability for losses resulting from the use of this report.

KEY DEFINITIONS

Schablonbeskattning: Swedish flat-rate capital taxation applied annually to ISK and KF accounts, based on a percentage of capital value.

Expected Return: Annualized historical return calculated from 3–5 years of daily price data.

Risk (Volatility): Standard deviation of historical returns, representing typical annual price fluctuation.

Sharpe Ratio: Risk-adjusted return metric; higher values indicate better return per unit of risk taken.

Efficient Frontier: The curve of optimal portfolios offering maximum return for each level of risk.

DATA SOURCES & METHODOLOGY

Historical price data is sourced from Yahoo Finance API. Tax rates reflect official Skatteverket (Swedish Tax Agency) publications. Transaction cost estimates are based on standard broker fee schedules in Sweden.

Portfolio optimization uses Modern Portfolio Theory (Markowitz mean-variance optimization). Projections compound returns annually after deducting Swedish taxes and estimated transaction costs. All figures are denominated in Swedish Kronor (SEK).

1. Executive Summary

Table 1: Executive Summary

Portfolio Value	500,000.00 SEK	Account Type	ISK
Tax Year	2024	Expected Return	8.92%
Risk (Vol)	18.45%	Sharpe Ratio	0.483

Note: Expected return and risk drive the projection range; a higher Sharpe ratio indicates better return per unit of risk. Use these KPIs to gauge whether the portfolio aligns with your goals and tolerance for volatility.

2. Methodology & Assumptions

Data Sources

Source	Description
Historical Prices	3–5 years daily data → expected returns and risk metrics
Tax Rates	Skatteverket official rates (schablonränta for ISK/KF, 30% gains for AF)
Transaction Costs	Broker courtage schedules (Start, Mini, Small, Medium, Fixed Price tiers)

All projections use end-of-day historical prices. Tax rates reflect current legislation and may change. Consult your broker's fee schedule for accurate cost estimates.

Projection Scenarios

Scenario	Calculation	Use Case
Optimistic	Return + Volatility	Upper bound — plan upside potential
Base Case	Expected Return	Most likely — central planning figure
Pessimistic	Return – 50% Vol	Conservative — stress test goals

Each year deducts tax and costs, then compounds net return for realistic wealth projection.

Limitations

Limitation	Impact
Historical ≠ Future	Past returns do not guarantee future performance
Static Assumptions	Current holdings maintained; trading changes outcomes

Limitation	Impact
Tax Law Changes	Rates based on current legislation; subject to revision
Estimation Only	Educational purposes; consult a financial advisor

3. Portfolio Composition

Allocation below shows where capital is deployed. High concentration in a single holding or sector amplifies drawdown risk in downturns; spreading across assets and industries generally improves resilience when one segment underperforms.

Table 2: Portfolio Holdings

Ticker	Allocation	Value (SEK)
AAPL	15.50%	77,500.00 SEK
MSFT	12.30%	61,500.00 SEK
GOOGL	10.20%	51,000.00 SEK
JNJ	8.50%	42,500.00 SEK
PFE	7.80%	39,000.00 SEK
JPM	9.20%	46,000.00 SEK
BAC	6.50%	32,500.00 SEK
XOM	8.00%	40,000.00 SEK
PG	7.50%	37,500.00 SEK
KO	6.00%	30,000.00 SEK
VZ	4.50%	22,500.00 SEK
NEE	4.00%	20,000.00 SEK

Note: Concentration above 20–25% in a single holding increases single-stock risk. Review positions with outsized weight relative to conviction.

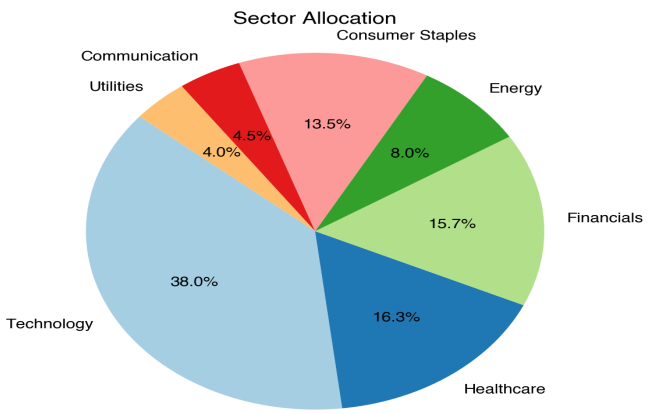

Figure 1: Sector Allocation. Each slice shows the combined allocation to that industry. Exposure above 40% in one sector creates industry-specific concentration risk. A spread of 10–25% per sector generally improves stability across market cycles.

4. Swedish Tax Analysis

Table 3: Tax Analysis

Component	Value	Meaning

Note: ISK/KF: Schablonbeskattning — a flat annual tax on capital, regardless of whether gains are realized. AF: 30% tax applies only when assets are sold.

5. Optimization Results

Strategy: Weights. Comparing Current to Weights-Opt shows whether rebalancing improves risk-adjusted return; Market-Opt indicates if expanding the universe could achieve better tradeoffs. If your current portfolio sits below the efficient frontier, the same return may be achievable with lower risk.

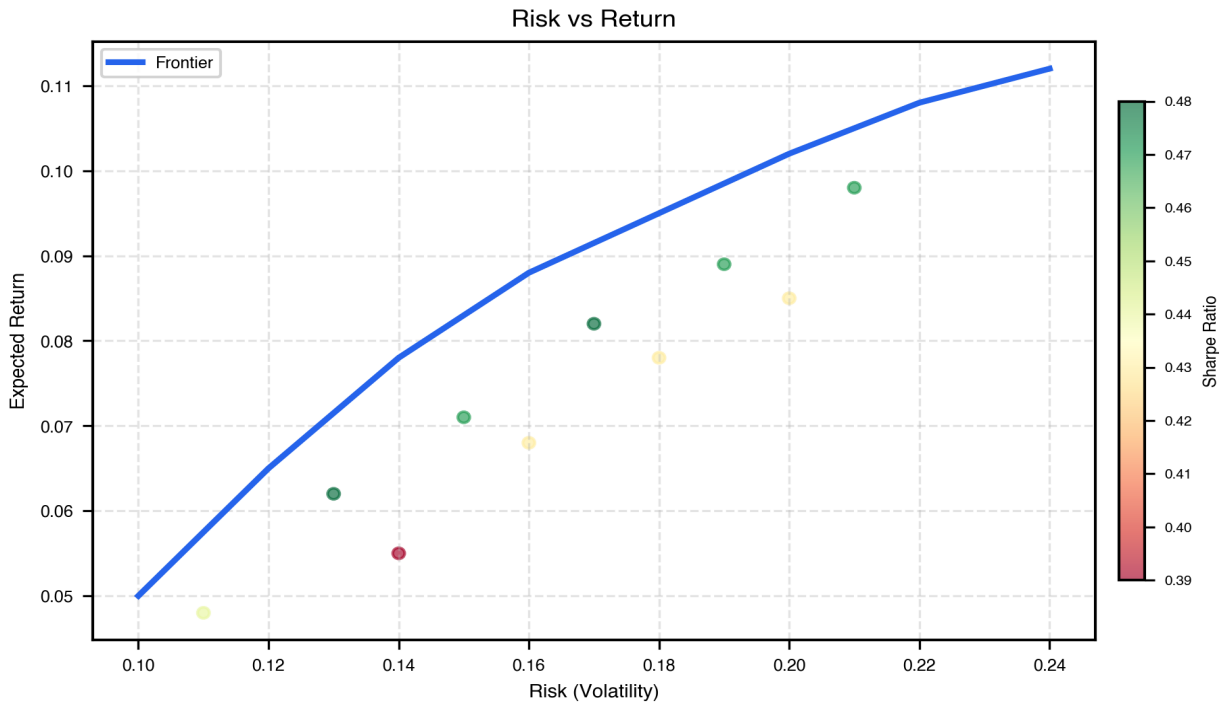

Figure 2: Efficient Frontier. The blue curve shows the optimal risk/return boundary. Portfolios below the curve are inefficient — the same return is available with less risk. The red star is your current position; markers show optimized alternatives.

6. Transaction Costs

Table 6: Transaction Costs

Component	Value	Impact

Note: Setup cost is one-time. Annual cost recurs with each rebalance cycle. Annual costs above 1% compound meaningfully over time. Consider a lower courtage tier or reducing rebalancing frequency.

7. Five-Year Projection

Net growth after Swedish taxes and costs. Use the pessimistic path to check that goals remain reachable in a bad market; if the range falls short of your target, consider increasing contributions or extending the time horizon. Base Case is the central planning figure.

8. Risk Analysis

Table 8: Risk Metrics

Metric	Value	Rating
Sharpe Ratio	0.483	Low
Volatility	18.45%	Moderate

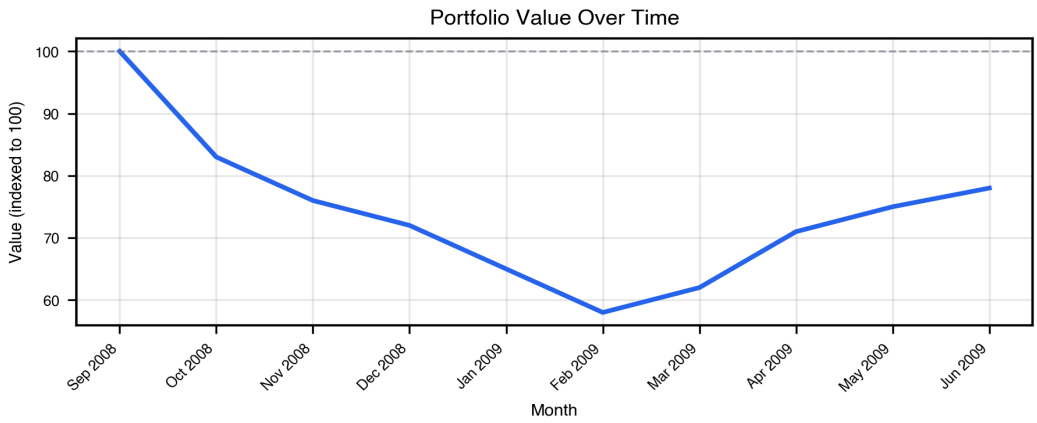
Note: High diversification (e.g. above 70) supports resistance to single-asset shocks. Sharpe above 1.0 is good risk-adjusted return. High volatility implies larger short-term swings—ensure your time horizon and comfort with drawdowns align with these metrics.

Stress Test Analysis

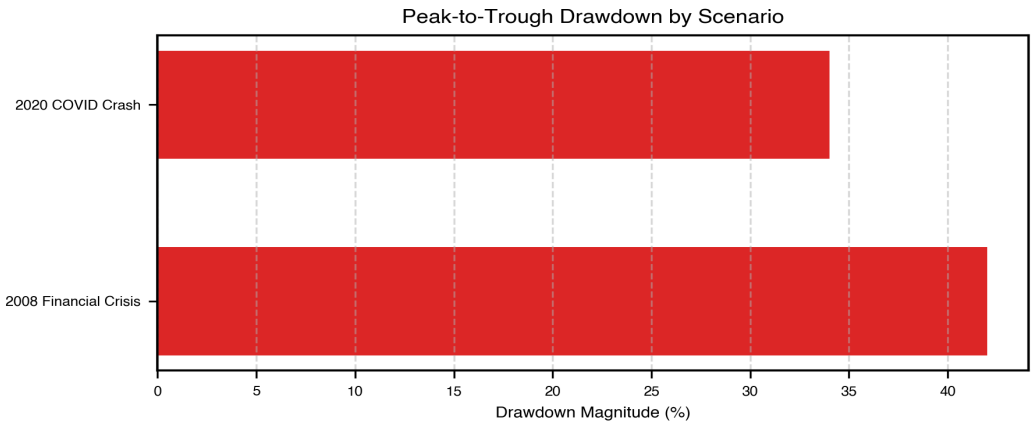
Resilience Score: 62/100 (Good)

Scenario	Estimated Impact	Interpretation
2008 Financial Crisis	-42.00%	Severe downside stress
2020 COVID Crash	-34.00%	Severe downside stress

This analysis shows how your portfolio would have performed during the 2008 Financial Crisis and 2020 COVID-19 crash. Double-digit drawdowns indicate meaningful risk exposure; consider diversification if this exceeds your tolerance.



Portfolio value over time during 2008 Financial Crisis. Value indexed to 100 at scenario start (crisis and recovery window).



Peak-to-Trough Drawdown: Shows how much your portfolio would have fallen from peak to trough during the 2008 Financial Crisis and 2020 COVID-19 crash. These represent two of the most severe market downturns in recent history, providing a realistic stress test of portfolio resilience.
